Week 5 R functions

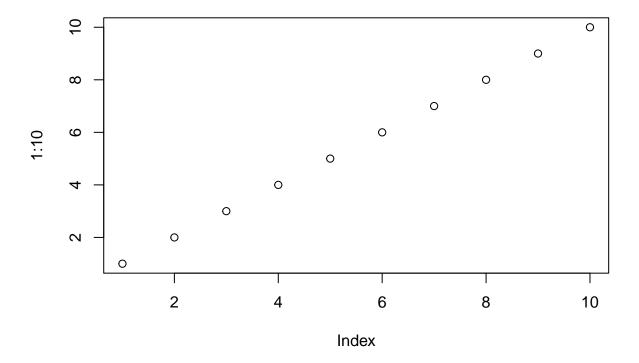

Kaito Tanaka

10/14/2021

Questions to answer:

Q1.Write a function grade() to determine an overall grade from a vector of student homework assignment scores dropping the lowest single score. If a student misses a homework (i.e. has an NA value) this can be used as a score to be potentially dropped. Your final function should be adquately explained with code comments and be able to work on an example class gradebook such as this one in CSV format: "https://tinyurl.com/gradeinput"

plot(1:10)

```
# Example input vectors to start with student1 <- c(100, 100, 100, 100, 100, 100, 100, 90)
```

```
student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)
```

Follow the guidelines from class

• Write a working snippet of code that solves a simple problem

```
#Straight forward mean()
student1 <- c(100, 100, 100, 100, 100, 100, 90)
mean(student1)
```

[1] 98.75

But... we need to drop the lowest score. First we need to identify the lowest score.

```
#Which element of the vector is lowest?
which.min(student1)
```

[1] 8

What I want is to now drop (i.e. exclude) the lowest score from my mean() calculation.

```
#This will return everything but the eigth element of the vector student1[-8]
```

[1] 100 100 100 100 100 100 100

Now we can use the answer from which.min() to return all other elements of the vector

```
#Our first working snippet
mean(student1[-which.min(student1)])
```

[1] 100

What about the other example students? Will this work for them?

We could try using na.rm=TRUE argument for mean but this is pants! Not a good approach i.e. unfair.

```
student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
mean(student2, na.rm=TRUE)
```

[1] 91

```
student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)
mean(student3, na.rm=TRUE)
```

[1] 90

Another approach is to mask (i.e. replace) all NA values with zero

First we need to find the NA elements of the vector. How do we find the NA elements?

```
student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
x<-student2
is.na(x)</pre>
```

[1] FALSE TRUE FALSE FALSE FALSE FALSE FALSE

```
which(is.na(x))
```

[1] 2

Now we have identified the NA elements. We want to "mask" them. Replace them with zero?

```
#This does not quite get us there
mean(x[-which(is.na(x))])
```

[1] 91

Instead we will make the NA elements zero

```
#This is useful!
x[is.na(x)] <-0
x</pre>
```

[1] 100 0 90 90 90 90 97 80

```
mean(x)
```

[1] 79.625

Recall we should drop the lowest score now...

```
x[is.na(x)]<-0
mean(x[-which.min(x)])</pre>
```

[1] 91

Now we are essentially there with our working snippet!

```
student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)
x<-student3
x[is.na(x)]<-0
mean(x[-which.min(x)])</pre>
```

[1] 12.85714

Now we make our function

Take the snippet and turn into a function Every function has three parts

- A name, in our case 'grade()'
- Input arguments, a vector of student scores
- The body i.e. our working snippet of code

Using RStudio, select 'Code > Extract Function'

```
grade <- function(x) {
    x[is.na(x)] <-0
    mean(x[-which.min(x)])
}

grade(student1)

## [1] 100

grade(student2)

## [1] 91

grade(student3)</pre>
```

[1] 12.85714

This looks great! Now, add comments to explain this to our future selves and others who want to use this function.

```
#'Calculate the average score for a vector of
#' student scores dropping the lowest score.
#' Missing values will be treated as zero.
#'
#' @param x A numeric vector of homework scores
#'
#' Oreturn Average score
#' @export
#'
#' @examples
#' student <- c(100, NA, 90, 97)
    grade(student)
#'
grade <- function(x) {</pre>
  \# mask NA with zero
  # Treat missing values as zero
  x[is.na(x)] < -0
  # Exclude lowest score from mean
  mean(x[-which.min(x)])
}
```

Now finally we can use our function on our "real" whole class data from this CSV format file: "https://tinyurl.com/gradeinput"

```
url<- "https://tinyurl.com/gradeinput"
gradebook<-read.csv(url, row.names=1)</pre>
```

```
apply(gradebook, 1, grade)
```

```

                                          86.00
                                                      91.75
                                                                 92.25
## student-15 student-16 student-17 student-18 student-19 student-20
                                                      82.75
                                                                 82.75
##
        78.75
                   89.50
                               88.00
                                          94.50
```

Q2. Using your grade() function and the supplied gradebook, Who is the top scoring student overall in the gradebook?

To answer this we run the apply() function and save the results.

```
results<-apply(gradebook, 1, grade)
sort(results, decreasing=TRUE)</pre>
```

```
student-8 student-13
## student-18
               student-7

                  63 100
                             78
                          86
## student-18
              91
                   0 100
                          87 100
## student-19
              91
                  68
                      75
                          86
                              79
## student-20 91
                  68
                     76
                          88
                             76
```

And look at correlation

```
cor(results, gradebook$hw5)
```

[1] NA

```
apply(masked.gradebook, 2, cor, x=results)
```

```
## hw1 hw2 hw3 hw4 hw5
## 0.4250204 0.1767780 0.3042561 0.3810884 0.6325982
```

Q5. Make sure you save your Rmarkdown document and can click the "Knit" button to generate a PDF foramt report without errors. Finally, submit your PDF to gradescope. [1pt]
